MaxxBot - AI Procurement Intelligence Assistant

Bot Specification Document

LAST UPDATED
January 26, 2026

TARGET LAUNCH
April 14, 2026

STAKEHOLDERS
Alex Rochlitz (Founder) | Botpress: David Paquet

Executive Summary

Goal

Build a production-ready AI procurement intelligence assistant that queries ScaleX-provided structured data tables, analyzes uploaded documents, and returns grounded, non-hallucinated procurement outputs.

Pain Points

- Enterprise buyers lack quick access to vendor intelligence and rate benchmarks
- Contract review and risk assessment is manual and time-consuming
- Treatment recommendations require expertise that's hard to scale

Success Criteria

- >=90% of Golden Questions answered correctly (30 questions across 6 categories)
- No critical hallucinations (all responses grounded in configured data)
- System is demo-ready and suitable for early production use by April 14, 2026

Bot Configuration

Bot Name	MaxxBot
Tone	Professional, consultative, data-driven procurement expert
Personality	Authoritative yet approachable; provides clear rationale for recommendations
Language(s)	English

Channels

Channel	Configuration	Notes
Web Chat	Yes	Embedded in ScaleX platform with authenticated sessions
HITL Channel	TBD	Admin access for logs and feedback review

Note: Mobile apps, WhatsApp, and other channels are explicitly out of scope per SOW Section 9

Core Requirements

Requirement	Description	Priority
Rate Benchmarking	Fuzzy matching on service names, location normalization, currency conversion with FX assumptions, confidence indicators	HIGH
Vendor Intelligence	Vendor profile lookup, shortlisting by service/location, red flag identification from configured data	HIGH
Risk Assessment	Scenario attribute extraction, risk detection using risksTable, severity assignment (LOW/MEDIUM/HIGH/CRITICAL), mitigation strategies	HIGH
Treatment Recommendation	Deterministic IF/THEN rule evaluation using treatmentRulesTable, priority ranking, explicit assumptions when inputs missing	HIGH
Proposal Comparison	PDF/DOCX upload (up to 2 docs), extraction of pricing/SLAs/scope/terms, pricing normalization, side-by-side comparison	HIGH
Contract Risk Analysis	Contract upload (PDF/DOCX), clause classification using contractClausesTable, risk flagging, recommended redline language	HIGH
Savings Calculation	Estimated savings ranges using methodologyTable heuristics, transparent assumptions	MEDIUM
Methodology Explanation	Plain-language explanations of logic and calculations, no exposure of internal prompts	MEDIUM

Key Capabilities Needed

- **Conversation Context Memory**: Persist user context across authenticated sessions, allow reset/clear, prevent cross-user leakage
- **Query and Response Logging**: Log prompts, tool calls, data sources, and responses with admin export
- **Feedback Capture**: Thumbs up/down on responses with reason codes and optional comments
- **Export Functionality**: Export responses or conversation segments to PDF/Excel
- **Graceful Failure Handling**: Never return empty or broken responses, clear error messaging
- **Demo/Example Queries**: Lightweight onboarding with example prompts aligned to Golden Questions

Knowledge & Data Sources

Knowledge Bases:

- ScaleX-provided structured data tables (~11 tables, ~14,500 rows total)
- Update frequency: Managed by ScaleX; Botpress will not modify table content

Tables:

Received Tables (11 tables, ~12,600 rows) - Data folder: `data/`

File	Description	Rows
TBL-001_TOWERS_v4.csv	Top-level service categories (towers)	15
TBL-002_CATEGORIES_COMPLETE.csv	Category taxonomy under each tower	120
TBL-003_BaseRates_v5_FINAL.csv	Rate benchmarks by service/location/tier	1,055
TBL-005_SERVICE_TYPES.csv	Service taxonomy with SLAs, pricing models	918
TBL-006_LOCATIONS_v4.csv	Locations with FX rates, cost index, tiers	186
TBL-009_SERVICE_VENDOR_MAP_v4.csv	Vendor-service relationships with rankings	4,693
TBL-010_VENDOR_LOCATIONS_VALIDATED.csv	Vendor delivery center locations	645
TBL-011_MODIFIERS.csv	Rate modifiers (complexity, language, etc.)	9
SERVICE_NAME_ALIASES_v3.csv	Fuzzy matching aliases for service names	1,463
VENDORID_MAPPING.csv	Vendor name normalization	1,742
VENDORS_BOTPRESS_FINAL_v4.csv	Full vendor profiles with red flags	1,742

Pending Tables (4 tables, ~250 rows) - Per SOW Section 4.2

Table	Description	Est. Rows	Status
TBL-012: risksTable	Risk identification and severity thresholds	~50	Alex to provide within 1 week
TBL-013: methodologyTable	Treatment logic and savings methodology	~25	Alex to provide within 1 week
TBL-014: treatmentRulesTable	Deterministic IF/THEN decision rules	~100	Alex to provide within 1 week
TBL-015: contractClausesTable	Contract clause parsing and redlines	~75	Alex to provide within 1 week

Total: ~12,850 rows across 15 tables

See `appendix-tables-and-golden-questions.md` for TBL-012 to TBL-015 schemas (from SOW Appendix A)

External Integrations:

- None required for Phase 1 (all data provided via tables)

Conversation Flow

        │
        └──→ [Contract Analysis]: Clause risks, severity, redline recommendations
```

Sample Interactions

These scenarios align with the 6 Golden Question categories used for acceptance testing.

Scenario 1: Rate Benchmarking

> **User:** What's the hourly rate for customer service agents in Manila?

> **Bot:** Based on our benchmark data, customer service agents in Manila typically range from $8-12/hour (USD) for Tier 1 locations, with a median of $10/hour. This reflects rates as of [data date]. Key factors affecting pricing include language requirements, technical complexity, and volume commitments.

> **User:** How does that compare to the Philippines overall?

> **Bot:** Manila rates are approximately 5-10% higher than provincial Philippine locations due to talent density and infrastructure. Provincial rates range $7-11/hour.

Confidence: HIGH (based on 127 data points in ratesTable for Philippines/customer service)

Project Boundaries & Requirements

Access Requirements

- ScaleX must provide all structured data tables with schemas and sample data
- Golden Questions defined in SOW Appendix B (30 questions across 6 categories) - expected answers must be grounded in table data
- Representative (sanitized) documents required for testing document processing
- Authentication method for session persistence must be confirmed

Scope Boundaries

- Only features explicitly listed in SOW Exhibit A are included
- All data tables are created, owned, and populated by ScaleX
- Botpress implements agent logic, workflows, and grounding logic
- Minor improvements after launch included in monthly maintenance
- Major new features require written agreement and may be billed additionally

Data Privacy & AI Usage

- All ScaleX-provided data remains exclusive property of ScaleX
- Data may not be reused for other clients (NDA and DPA apply)
- Bot conversations processed by AI models for functionality
- No exposure of internal prompts to end users

Performance Targets (Best Effort)

- Standard conversational responses: Generally within a few seconds
- Document analysis: Visible progress feedback, reasonable enterprise timeframe
- Performance targets are not strict SLAs per SOW Section 7

Pending Decisions

1. **Authentication Method**: How will users authenticate to enable session persistence?
2. **Deployment Location**: Where will MaxxBot be embedded? (standalone app, existing platform, etc.)
3. **Admin Access**: Who needs access to logs, feedback data, and exports?
4. **Data Table Format**: What format will ScaleX provide tables in? (Airtable, CSV, database)
5. **Golden Question Expected Answers**: Need to confirm expected outputs for each of the 30 Golden Questions based on actual table data

Acceptance Criteria (Per SOW Section 8)

Functional Delivery is achieved when:

Criteria	Requirement
Accuracy	>=90% of Golden Questions answered correctly
Grounding	No critical hallucinations
Capabilities	All HIGH priority features operate end-to-end
Context	User context persists across authenticated sessions
Operations	Logging, feedback, and export features operational
Readiness	Demo-ready and suitable for early production use

Functional Delivery is based on correctness, usability, and demo readiness. Not contingent on strict latency thresholds.

Next Steps

1. **Schedule requirements workshop** to review data tables and confirm expected answers for Golden Questions
2. **ScaleX provides** table schemas, sample data, and representative test documents
3. **Confirm authentication method** for session persistence
4. **Establish iteration cadence** (recommend weekly check-ins)
5. **Create Linear project** to track development milestones

Note: Golden Questions already defined in SOW Appendix B - see `appendix-tables-and-golden-questions.md`

Project Timeline

Milestone	Target Date
Contract Signed	January 21, 2026
Requirements Workshop	TBD (this week)
Data Tables Received	TBD
Iteration 1 Build	February - March 2026
Functional Delivery	**April 14, 2026**
Client Launch Event	April 28, 2026

Credit clause: $1,495 credit if Functional Delivery not achieved by April 14, 2026 due solely to Botpress fault.

Project Collaboration Guidelines

To keep things running smoothly, we suggest that both sides aim to respond to communication within two business days.

We'd appreciate timely access to any systems, sandboxes, or documentation needed to build and test the bot effectively.

Responsible AI Practices

The bot will always follow ethical AI practices to ensure a respectful and transparent user experience:

- It will provide fact-based, clear, and non-hyped messaging
- It will not pretend to be human, and will never fabricate personal stories or identities
- It will comply with OpenAI's usage policies and general best practices for AI behavior
- Critical: All responses must be grounded in ScaleX-provided data sources with no hallucination

Additional Notes

- If anything is not covered in the above sections, it is assumed to not be part of the implementation scope.
- We do not build flows, integrations, or plugins for software lacking publicly available, versioned API documentation (e.g., REST/GraphQL specifications, SDK documentation, or developer portals).
    - If no such documentation exists and we're unable to connect, we may request a working CURL snippet or code sample from you. You must then either supply functional code or obtain it from the vendor.
    - If these conditions aren't met, we will decline the integration work.
- During implementation, we will provide up to two releases (iterations), with two rounds of QA revisions for each. After launch, minor improvements are included as part of ongoing maintenance. Major changes or new features should be discussed with your Customer Success Manager and may be billed additionally with prior approval.
